An 8 kba methionine-rich protein (MRP) from soybean (Glycine max) cotyledon: identification, purification and N-terminal sequence.";
J. Agric. Food Chem. 44:2930-2935(1996).
J. Subryl: The protein consists of two chains linked by 2 disulfide bonds.

J. Subryl: Belongs to the 2S seed storage albumins family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |||:::

Sequence 18, Application US/09323195A

Patent No. 646257

GENERAL INFORMATION:
APPLICANT: Pullman, Gerald
APPLICANT: Perrera, Ranjan
TITLE OF INVENTION: UICLIN-LIKE SEED STORAGE PROTEIN GENE PROMOTER AND
TITLE OF INVENTION: WICHIANDS OF USING THE SAME
TITLE OF INVENTION: WICHIANDS OF USING THE SAME
TITLE OF INVENTION: WIGHTON WIMBER: US/09/323,195A
CURRENT APPLICATION NUMBER: US/09/323,195A
CURRENT FILING DATE: 1999-06-01
NUMBER OF SEQ ID NOS: 19
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 18
LENGING 148
                                                                                                                                                                                                                                                                                                                                                                                                                                           1273 GTGGTGCCACAGAACTTCGCC---GTCGCTGGAAAGTCCCAGAGCGAGAACTTCGAATAC 1329

Result Š.

The invention relates to a modified anaphylactic food allergen has an amino acid sequence that is substantially identical to that of natural canaphylactic food allergen, except for a cysterine residue that has been modified so that it cannot participate in the disulphide bond. The modification may also comprise mutation of the IGE binding sites to reduce allergenicity. Also included are: (1) a method of making a conficied anaphylactic food allergen; (2) a nucleotide molecule encoding or for causing a site specific mutation in the modified anaphylactic food allergen; (4) a method of treating an individual by reducing the clinical response to a natural anaphylactic food allergen; (4) a method of treating an individual by reducing the clinical response to a natural anaphylactic food allergen; and an isolated fragment of peanut allergen Ara h: The modified anaphylactic food allergen is useful for preventing or treating allergic reactions associated with any natural allergen such as food, insect, rubber or preferably anaphylactic allergens: It is also useful for treating wounds in mammals such as bovine, canine, feline, caprine, covine, porcine, murine or equine species. The present sequence is a covine, porcine, murine or equine species. The present sequence is a covine allergen (e.g. Ara h!, h2 or h3) treating allergic reactions associated with e.g. anaphylactic allergens. 27; Fig 68B; 300pp; English. Claim

The invention relates to a modified anaphylactic food allergen whose amino acid sequence is substantially identical to that of a natural anaphylactic food allergen. The natural anaphylactic food allergen includes at least one cysteine residue that participates in a disulphide bond when the natural anaphylactic food allergen is in its native conformation, except that the cysteine residue has been modified so that it cannot participate in the disulphide bond. Also included are a method of making a modified anaphylactic food allergen, a nucleotide molecule.

encoding a modified anaphylactic food allergen defined above, a nucleotide molecule for causing a site specific mutation in a gene encoding a natural anaphylactic food allergen, a transgenic plant or animal expressing a modified anaphylactic food allergen defined above, a natural anaphylactic food allergen by reducing the clinical response to a natural anaphylactic food allergen by administering a modified anaphylactic food allergen and an isolated fragment of peanut allergen anaphylactic food allergen and an isolated fragment of peanut allergen Ara h. comprising at least 10 consecutive amino acids of AD27464 or AD27465. About 10-17% of the amino acids have been modified in at least one 1gE epitope or all the 1gE epitopes recognised when the natural anaphylactic food allergen is contacted with serum IgE from individual(s) allergic to the natural anaphylactic food allergen Ara hi, Ara hi, Ara hi (and their encoding connaphylactic food allergen Ara hi, Ara hi, Ara hi (and their encoding connat allergen Jug ni. The modified anaphylactic food allergen can be used for treating allergic reactions or wounds. The present sequence represents a Peanut allergen of the invention (or its fragment). 99 240 360 420 480 540 900 120 180 84 IlePheProGlyCysProArgHisTyrGluGluProHisThrGlnGlyArgArgSerGln 103 123 164 AsnAsnAspAsnGlnLeuAspGlnPheProArgArgPheAsnLeuAlaGlyAsnThrGlu 183 203 43 23 63 83 24 AsnArgileGluSerGluGlyGlyTyrIleGluThrTrpAsnProAsnAsnGlnGluPhe 64 PheTyrSerAsnAlaProGlnGluIlePheIleGlnGlnGlyArgGlyTyrPheGlyLeu 601 AGCCCATACAGCCCGCAAAGTCAGCCTAGACAAGAAGAGCGTGAATTTAGCCCTCGAGGA CGGCAGCAACCGGAGGAGAACGCGTGCCAGTTCCAGCGCCTCAATGCGCAGAGACCTGAC 61 AATCGCATTGAATCAGAGGGGGGTTACATTGAGACTTGGAACCCCCAACAACCAGGAGTTC 121 GAATGCGCCGGCGTCGCCCTCTCTCGCTTAGTCCTCCGCCGCCGCACGCCCTTCGTAGGCCT TCCCAAAGACCACCAAGACGTCTCCAAGGAGAAGACCAAAGCCAACAGCAACGAGATAGT CACCAGAAGGTGCACCGTTTCGATGAGGGTGATCTCATTGCAGTTCCCACCGGTGTTGCT TTCTGGCTCTACAACGACCACGACACTGATGTTGTTGCTGTTTCTCTTACTGACACCAAC 481 AACAACGACAACCAGCTTGATCAGTTCCCCAGGAGATTCAATTTGGCTGGGAACACGGAG CAAGAGTTCTTAAGGTACCAGCAACAAAGCAGACAAAGCAGAAGAAGAAGCTTACCATAT 510 507 0 0 Length:

The sequence represents the amino acid sequence of anaphylactic antigen Ara h 3. Ara h 3 is an anaphylactic antigen (h), which was used to design antigenic peptides having a reduced ability to bind immunoglobulin E (19E) as compared with the intact (h), or having a sequence substantially identical to a portion of sequence of an antigen that includes at least one IgE binding site of the peptide cone IgE binding site of the peptide cone IgE binding site of the peptide cone IgE binding site of the peptide consequence of an antigen that includes at least one IgE binding site of the peptide con an antigen. This is done by identifying prior display of allergic reaction to an antigen, or an antigen or an individual at risk of allergic reaction to an antigen, or an antigen or an antigen or an antigen or an antigen or an antigen or an individual when exposed to the antigen. Following this an antigen symptoms when exposed to the antigen. Following this an antigen-specific IgE present on one or more mast cells or basophis in the individual's serum is identified. The individual is then contacted with a peptide corresponding to a portion of the antigen, which is selected, formulated, and delivered so that binding of the peptide to antigen-specific IgE is reduced as compared with IgE binding or province of interacting and delivered so compared with IgE binding or province or province or province or previous is also useful for treating and
                                                                                                                                                                                                                                                                                                                          Antigenic fragments useful for reducing anaphylactic risk and reducing the severity and/or number of allergic symptoms in individuals sensitive to antigens, have reduced ability to bind Immunoglobulin E.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ArgGlnGlnProGluAsnAlaCysGlnPheGlnArgLeuAsnAlaGlnArgProAsp

The novel polypeptide has an N-terminal element consisting of 4-16 residues of a mammalian Ii-Key peptide and its non-N-terminal deletion modifications, a chemical structure covalently linking the N-terminal element to an MHC class II-presented epitope of a C-terminal element to an MHC class II-presented epitope of a C-terminal element to an HHC class III-presented epitope, which binds to an antigenic peptide binding site of an MHC class II molecule. The antigen presentation enhancing hybrid polypeptide has the following activities: antibacterial, virucide, fungicide, antirheumatic, antiatrhritic, neuroprotective, dermatological, immunosuppressive, antiatrhritic, neuroprotective, dermatological, immunosuppressive, antinflammatory, antidiabetic, and antithyroid. The antigen presentation enhancing hybrid polypeptide is useful for modulating the immune response in an individual and for treating infections (such as bacteria, virus, parasite and fungus), rheumatoid arthritis, multiple sclerosis, lupus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ठे
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           쉱
                                                                                                                                                                                                                    This is the amino acid sequence of the Ara h 3 protein from Arachis hypogea. The Ara h 3 protein has 4 IgE (Immunoglobulin E) binding epitopes, one of which is immunodominant (AAY15281). Note: The first three amino acids of this sequence are not encoded by the related nucleotide sequence. By modifying the IgE binding sites the ability of the allergen to provoke an immune response is downregulated. The epitopes of the IgE binding sites an therefore be modified in genetically engineered plants and animals to elicit less of an allergic response. (Updated on 17-OCT-2003 to standardise OS field)
